## MEAN

Dr. Indrajit Ray, Associate Professor<br>Department of Human Physiology, Women's College<br>Agartala, Tripura (West), India, PIN-799001

The mean (average or arithmetic average) of observed values or data is the sum of the values of the all observed data divided by the total number of observed data. It is a common measure of central tendency and acts as a representative figure for the all observed values or data.

## A. MEAN OF UNGROUPED DATA (RAW DATA)

Ungrouped data is raw data or values that have not been categorized into groups under different intervals of same range. The mean of the ungrouped data is calculated using the following formulae:
(a) Mean $(\overline{\mathrm{X}})=\left(\Sigma \mathrm{X}_{\mathrm{i}}\right) / \mathrm{n}$

Where $\overline{\mathrm{X}}$ (X bar) stands for sample mean, $\Sigma$ (capital sigma) means summation, $\Sigma \mathrm{X}_{\mathrm{i}}$ indicates summation of all individual values of the sample, and $n$ represents number of individuals in the sample.

Example: The resting heart rates (beats per minute or bpm) of 10 men are 78, 60, 82, 77, 67, 72, $74,80,67$ and 63 . Calculate/ Find the mean of the resting heart rates of the men.

## Answer:

The mean of the above-mentioned ungrouped data can be calculated using the following formula:

Mean $(\overline{\mathrm{X}})=\left(\Sigma \mathrm{X}_{\mathrm{i}}\right) / \mathrm{n}$
Where $\overline{\mathrm{X}}$ ( X bar) stands for sample mean, $\Sigma \mathrm{X}_{\mathrm{i}}$ indicates sum of the all individual values of the sample, and n represents number of individuals in the sample

Here, $\Sigma \mathrm{X}_{\mathrm{i}}=(78+60+82+72+67+72+74+80+67+68)$
$=720$
$\mathrm{n}=10$
So, mean $(\overline{\mathrm{X}})=720 / 10$
$=72$

Therefore, the mean of the above-mentioned resting rates is 72 bpm .
(b) Mean $(\overline{\mathrm{X}})=\left(\mathrm{f}_{1} \mathrm{X}_{1}+\mathrm{f}_{2} \mathrm{X}_{2}+\ldots+\mathrm{f}_{\mathrm{n}} \mathrm{X}_{\mathrm{n}}\right) /\left(\mathrm{f}_{1}+\mathrm{f}_{2}+\ldots+\mathrm{f}_{\mathrm{n}}\right)$

$$
=\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{X}_{\mathrm{i}} / \Sigma \mathrm{f}_{\mathrm{i}}
$$

Where $\overline{\mathrm{X}}$ ( X bar) is the sample mean; $\mathrm{X}_{1}, \mathrm{X}_{2}, \ldots, \mathrm{X}_{\mathrm{n}}$ are observed values with respective frequencies $f_{1}, f_{2}, \ldots, f_{n} ; \Sigma f_{i} X_{i}$ is the sum of the values of the all observations $\left(f_{1} X_{1}+f_{2} X_{2}+\ldots\right.$ $+f_{n} X_{n}$ ); and $\Sigma f_{i}$ is the sum of the numbers of the all observations ( $f_{1}+f_{2}+\ldots+f_{n}$ ).

Example: The resting heart rates of 10 men are presented in the table below:

| Resting <br> heart <br> rates(bpm) <br> $\left(\mathrm{X}_{\mathrm{i}}\right)$ | 63 | 67 | 69 | 72 | 74 | 80 | 82 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Number <br> ofmen $\left(\mathrm{f}_{\mathrm{i}}\right)$ | 1 | 2 | 1 | 2 | 2 | 1 | 1 |

Calculate (Find or Compute) the mean of the resting heart rate of the men.

## Answer:

The mean of the above-mentioned ungrouped frequency data can be calculated using the following formula:

$$
\begin{aligned}
\operatorname{Mean}(\overline{\mathrm{X}}) & =\left(\mathrm{f}_{1} \mathrm{X}_{1}+\mathrm{f}_{2} \mathrm{X}_{2}+\ldots+\mathrm{f}_{\mathrm{n}} \mathrm{X}_{\mathrm{n}}\right) /\left(\mathrm{f}_{1}+\mathrm{f}_{2}+\ldots+\mathrm{f}_{\mathrm{n}}\right) \\
& =\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{X}_{\mathrm{i}} / \Sigma \mathrm{f}_{\mathrm{i}}
\end{aligned}
$$

Where $\bar{X}$ is the sample mean; $X_{1}, X_{2}, \ldots, X_{n}$ are observed values with respective frequencies $f_{1}$, $f_{2}, \ldots, f_{n} ; \Sigma f_{i} X_{i}$ is the sum of the values of the all observations ( $f_{1} X_{1}+f_{2} X_{2}+\ldots+f_{n} X_{n}$ ); and $\Sigma f_{i}$ is the sum of the numbers of the all observations $\left(f_{1}+f_{2}+\ldots+f_{n}\right)$

For the above-mentioned data, $\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{X}_{\mathrm{i}}$ and $\Sigma \mathrm{f}_{\mathrm{i}}$ can be calculated in the manner as shown in the following table:

| Resting heart rates of men <br> (beats per minute or bpm$)\left(\mathrm{X}_{\mathrm{i}}\right)$ | Number of men $\left(\mathrm{f}_{\mathrm{i}}\right)$ | $\mathrm{f}_{\mathrm{i}} \mathrm{X}_{\mathrm{i}}$ |
| :--- | :--- | :--- |
| 63 | 1 | 63 |
| 67 | 2 | 134 |
| 69 | 1 | 69 |
| 72 | 2 | 144 |
| 74 | 2 | 148 |
| 80 | 1 | 80 |
| 82 | $\Sigma \mathrm{f}_{\mathrm{i}}=10$ | 82 |
| Total | $\mathrm{f}_{\mathrm{i}} \mathrm{X}_{\mathrm{i}}=720$ |  |

Here, $\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{X}_{\mathrm{i}}=720, \Sigma \mathrm{f}_{\mathrm{i}}=10$
So, mean $(\overline{\mathrm{X}})=720 / 10$

$$
=72
$$

Therefore, the mean of the above-mentioned resting rates is 72 bpm .

## B. MEAN OF GROUPED DATA

Grouped data are data constituted by arranging individual observed values or data of a variable into groups under different intervals of same range, so that frequency distributions of these groups serve as a convenient way of summarizing the data.

Example: Body weights ( kg ) of 40 men of a certain village are presented in the table given below:

| Class intervals of body weight (kg) | Frequency (i.e., Number of men) |
| :--- | :--- |
| $45-50$ | 3 |
| $50-55$ | 5 |
| $55-60$ | 7 |
| $60-65$ | 11 |
| $65-70$ | 5 |
| $70-75$ | 7 |
| $75-80$ | 2 |

Find the mean of the body weights of the village men.

## Answer:

## 1. Direct method

The mean of the above-mentioned grouped frequency data can be calculated using the following formula:

Mean $(\overline{\mathrm{X}})=\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{X}_{\mathrm{i}} / \Sigma \mathrm{f}_{\mathrm{i}}$
Where $\overline{\mathrm{X}}$ is the sample mean; $\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{X}_{\mathrm{i}}$ is the sum of the products of the class mid-points $\left(\mathrm{X}_{\mathrm{i}}\right)$ and respective frequencies ( $\mathrm{f}_{\mathrm{i}}$ ) of the all class intervals; $\Sigma \mathrm{f}_{\mathrm{i}}$ is the sum of the frequencies $\left(\mathrm{f}_{\mathrm{i}}\right)$ of the all class intervals.

For the above-mentioned grouped frequency data, $\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{X}_{\mathrm{i}}$ and $\Sigma \mathrm{f}_{\mathrm{i}}$ can be calculated in the manner as shown in the following table:

| Class intervals of body <br> weight $(\mathrm{kg})$ | Number of men <br> $\left(\mathrm{f}_{\mathrm{i}}\right)$ | Class mid-point or <br> Class mark $\left(\mathrm{X}_{\mathrm{i}}\right)$ | $\mathrm{f}_{\mathrm{i}} \mathrm{X}_{\mathrm{i}}$ |
| :--- | :--- | :--- | :--- |
| $45-50$ | 3 | $(45+50) / 2=47.5$ | $47.5 \mathrm{x} 3=142.5$ |
| $50-55$ | 5 | 52.5 | 262.5 |
| $55-60$ | 7 | 57.5 | 402.5 |
| $60-65$ | 11 | 62.5 | 687.5 |
| $65-70$ | 5 | 67.5 | 337.5 |
| $70-75$ | 7 | 72.5 | 507.5 |
| $75-80$ | 2 | 77.5 | 155 |
| Total | $\Sigma \mathrm{f}_{\mathrm{i}}=40$ |  | $\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{X}_{\mathrm{i}}=2495$ |

Here, $\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{X}_{\mathrm{i}}=2495, \Sigma \mathrm{f}_{\mathrm{i}}=40$
So, mean $(\overline{\mathrm{X}})=2495 / 40$

$$
=62.375
$$

Therefore, the mean of the above-mentioned body weights is 62.375 kg .
This method is referred to as the direct method.

## 2. Assumed mean method

The mean of the above-mentioned grouped frequency data can be calculated using the following formula:
$\operatorname{Mean}(\overline{\mathrm{X}})=\mathrm{a}+\left(\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{d}_{\mathrm{i}} / \Sigma \mathrm{f}_{\mathrm{i}}\right)$
Where $\overline{\mathrm{X}}$ is the sample mean; 'a' is the assumed mean; $\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{d}_{\mathrm{i}}$ is the sum of the products of deviations ( $\mathrm{d}_{\mathrm{i}}$ ) of the class mid-points (from ' $a$ ') and respective frequencies ( $\mathrm{f}_{\mathrm{i}}$ ) for the all class intervals; $\Sigma \mathrm{f}_{\mathrm{i}}$ is the sum of the frequencies ( $\mathrm{f}_{\mathrm{i}}$ ) of the all class intervals.

For the above-mentioned grouped frequency data, 'a', $\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{d}_{\mathrm{i}}$ and $\Sigma \mathrm{f}_{\mathrm{i}}$ can be calculated in the manner as shown in the following table:

| Class interval | Number of men <br> $\left(\mathrm{f}_{\mathrm{i}}\right)$ | Class mid-point <br> $\left(\mathrm{X}_{\mathrm{i}}\right)$ | $\mathrm{d}_{\mathrm{i}}($ deviation $)=$ <br> $\mathrm{X}_{\mathrm{i}}-\mathrm{a}$ (assumed <br> mean) | $\mathrm{f}_{\mathrm{i}} \mathrm{d}_{\mathrm{i}}$ |
| :--- | :--- | :--- | :--- | :--- |
| $45-50$ | 3 | 47.5 | -15 | -45 |
| $50-55$ | 5 | 52.5 | -10 | -50 |
| $55-60$ | 7 | 57.5 | -5 | -35 |
| $60-65$ | 11 | 62.5 | 0 | 0 |
| $65-70$ | 5 | 67.5 | 5 | 25 |
| $70-75$ | 7 | 72.5 | 10 | 70 |
| $75-80$ | 2 | 77.5 | 15 | 30 |
| Total | $\Sigma \mathrm{f}_{\mathrm{i}}=40$ |  |  | $\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{d}_{\mathrm{i}}=-5$ |

Here, the first step is to select the class mid-point which lies in the centre of the column of $X_{i}$ (i.e., 62.5) as the assumed mean, and to indicate it by ' $a$ '.

The second step is to calculate the difference $d_{i}$ between ' $a$ ' and each class mid-point i.e., the deviation ( $\mathrm{d}_{\mathrm{i}}$ ) of ' a ' from each class mid-point $=\mathrm{X}_{\mathrm{i}}-\mathrm{a}=\mathrm{X}_{\mathrm{i}}-62.5$

The third step is to calculate the product of $\mathrm{d}_{\mathrm{i}}$ and respective $\mathrm{f}_{\mathrm{i}}$, the sum of the all products $\left(\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{d}_{\mathrm{i}}\right)$ and the sum of the all frequencies $\left(\Sigma \mathrm{f}_{\mathrm{i}}\right)$ as shown in the table.

Here, $\mathrm{a}=62.5, \Sigma \mathrm{f}_{\mathrm{i}} \mathrm{d}_{\mathrm{i}}=-5, \Sigma \mathrm{f}_{\mathrm{i}}=40$
So, mean $(\overline{\mathrm{X}})=62.5+(-5 / 40)$

$$
\begin{aligned}
& =62.5+(-0.125) \\
& =62.375
\end{aligned}
$$

Therefore, the mean of the above-mentioned body weights is 62.375 kg .

This method is referred to as the assumed mean method.

## 3. Step-deviation method

The mean of the above-mentioned grouped frequency data can be calculated using the following formula:
$\operatorname{Mean}(\overline{\mathrm{X}})=\mathrm{a}+\mathrm{h}\left(\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}} / \Sigma \mathrm{f}_{\mathrm{i}}\right)$
Where $\bar{X}$ is the sample mean; 'a' is the assumed mean; ' $h$ ' is the class size; $\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}}$ is the sum of the products of step-deviations $\left(\mathrm{u}_{\mathrm{i}}\right)$ and respective frequencies $\left(\mathrm{f}_{\mathrm{i}}\right)$ of the all class intervals; $\Sigma \mathrm{f}_{\mathrm{i}}$ is the sum of the frequencies ( $f_{i}$ ) of the all class intervals.

For the above-mentioned grouped frequency data, 'a', $\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}}$ and $\Sigma \mathrm{f}_{\mathrm{i}}$ can be calculated in the manner as shown in the following table:

| Class <br> interval | Number of $\operatorname{men}\left(\mathrm{f}_{\mathrm{i}}\right)$ | Class mid-point ( $\mathrm{X}_{\mathrm{i}}$ ) | $\mathrm{d}_{\mathrm{i}}$ (deviation) $=X_{i}-a$ <br> (assumed mean) | $\mathrm{u}_{\mathrm{i}} \quad$ (stepdeviation) $=\left(X_{i}-\right.$ <br> a) $/ \mathrm{h}$ <br> (class <br> size) | $\mathrm{f}_{\mathrm{i}} \mathrm{u}_{i}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 45-50 | 3 | 47.5 | -15 | -3 | -9 |
| 50-55 | 5 | 52.5 | -10 | -2 | -10 |
| 55-60 | 7 | 57.5 | -5 | -1 | -7 |
| 60-65 | 11 | 62.5 | 0 | 0 | 0 |
| 65-70 | 5 | 67.5 | 5 | 1 | 5 |
| 70-75 | 7 | 72.5 | 10 | 2 | 14 |
| 75-80 | 2 | 77.5 | 15 | 3 | 6 |
| Total | $\Sigma \mathrm{f}_{\mathrm{i}}=40$ |  |  |  | $\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}}=-1$ |

Here, the first step is to select the class mid-point which lies in the centre of the column of $X_{i}$ (i.e., 62.5) as the assumed mean, and indicate it by ' $a$ '.

The second step is to calculate the difference $d_{i}$ between ' $a$ ' and each class mid-point i.e., the deviation $\left(d_{i}\right)$ of ' $a$ ' from each class mid-point $=X_{i}-a=X_{i}-62.5$

The third step is to calculate the step-deviation $\left(u_{i}\right)$, the products of $u_{i}$ and respective $f_{i}$, the sum of the all products $\left(\Sigma \mathrm{f}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}}\right)$ and the sum of the all frequencies $\left(\Sigma \mathrm{f}_{\mathrm{i}}\right)$ as shown in the table.

Here, $\mathrm{a}=62.5, \mathrm{~h}=5, \Sigma \mathrm{f}_{\mathrm{i}} \mathrm{u}_{\mathrm{i}}=-1, \Sigma \mathrm{f}_{\mathrm{i}}=40$
So, mean $(\overline{\mathrm{X}})=62.5+5 \times(-1 / 40)$

$$
\begin{aligned}
& =62.5-0.125 \\
& =62.375
\end{aligned}
$$

Therefore, the mean of the above-mentioned body weights is 62.375 kg .
This method is referred to as the step-deviation method.
